growth factor - useful to regenerate or treat damaged blood vessels disclosure; Fig 8: 28pp; English.

Bovine beta-endothelial cell growth factor (beta-ECGF; W03999) having a mol.wt. of 20 kD can be purified at least 16300 fold from bovine brain using heparin-Sepharose affinity chromatography. ECGF is useful for, among other purposes, diagnostic applications and has potential in the treatment of damaged blood vessels or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            69 YIKSTETGQYLAMDTDGLLYGSQTPNEECLFLERLEENHYNTYISKKHAEKNWFVGLKKN 128

Human recombinant endothelial cell growth factors (ECGF) beta
(W06816) and alpha (W06817) differ only at their N-terminal ends.
They can be produced in transformed prokaryotic or eukaryotic host
cells using DNA sequences (T45983 and T45984, respectively) derived
from the complete human ECGF cDNA (T45885). Large quantities of
the ECGFs are produced by culturing the host cells and recovering
the proteins. ECGFs have utility in the growth and amplification
of endothelial cells in culture. They can potentially be used to
tread damaged blood vessels and other endothelial cell-lined

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Compositions for promoting wound healing - containing endothelial
cell growth factor polypeptides
Claim 1: Column 16: 23pp. English.
This sequence represents the amino acid sequence of the mature human
beta-endothelial cell growth factor (b-ECGF). This amino acid sequence
is identical to the alpha-ECGF but the beta sequence contains an extra
20 N-terminal amino acids. The sequence was isolated from a human brain
stem cell cDNA library using a probe designed based on fragments of the
bovine ECGF (see W75416-W75418). The ECGF protein can be used in
compositions for promoting wound healing. ECGF is also used to grow
sequence 154 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           69 YIKSTETGQYLAMDTDGLLYGSQTPNEECLFLERLEENHYNTYISKKHAEKNWFVGLKKN 128

This sequence represents the complete amino acid sequence of the human endothelial cell growth factor (ECGF). The protein is further processed to generate the beta-ECGF (starting from Ala at position 2; W75414) and alpha-ECGF (starting from the Asn at position 22; W75413). When the beta-ECGF is cleaved with trypsin, the resulting N-terminal sequence is similar to the N-terminal sequence of acidic fibroblast growth factor (a-FGF). The sequence was isolated from a human brain stem cell cDNA library using a probe designed based on fragments of the bovine ECGF (see W75418). The ECGF protein can be used in compositions for promoting wound healing. ECGF is also used to grow cells on a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ä

Fibroblast growth factor mutein and DNA - having reduced receptor binding and able to bind heparin, useful for treating and regulating the binding and able to bind heparin, useful for treating and regulating binding and able to bind heparin, useful for treating and regulating Theparin-related disorders e.g. thrombosis

Ensclosure; Page 52; 71pp; Brogish.

This is the amino acid sequence of fibroblast growth factor-1

(FGF-1). Claimed DNA molecules of the invention encode FGF mutein polypeptides (see W75711-20) that show reduced FGF receptor binding activity but which retain the ability to bind heparin. For FGF-1

Controlly acid residues with an optional further replacement of the Cys residues to reduce aggregation. The mutein the Glu-102 residue. The mutein may be further modified by the Glu-102 residues to reduce aggregation. The mutein is obtained by site-specific or site-directed mutagenesis of FGF-1

CNA, incorporation of the mutated DNA into a vector and expression in host cells. The FGF muteins are used to treat heparin-related clisorders, such as excessive bleeding induced by heparin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      inserts, a specific oligoniclectide was designed. This coligoniclectide was designed. This coligoniclectide was based upon a partial AA sequence analysis of the amino terminus of ECGF (see P70480 and P70481). Fig 3c sets forth for comparison the AA sequence of cyanogen bromide-cleaved bovine alpha and beta ECGF (P70834). The two clones that were isolated, ECGF clones I and 29, were analysed in further detail. The nuclectide sequence of these clones and the AA sequence deduced from the nuclectic acid sequence is shown in Fig 8 (see N70788 and P70482).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               13 TEKFNLP-PG--NYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEV 69

When you will are an expected producted agent and conjugates of growth factor receptor ligand and targetted agent.

Partic. DNA or cytotoxin, used to control cell proliferation in the eye, e.g. to prevent growth of pterygii and corneal clouding to a claim 33; Page 140-141; 204pp; English.

ENGINE 33; Page 140-141; 204pp; English.

ENGINE 33; Page 140-141; 204pp; English.

ENGINE 4 are fibroblast growth factors can be respectively. DNA encoding trowth factors can be used to create an FGF/saporin fusion protein. DNA encoding such fusion proteins are useful for targetting saporin (a cytotoxin) to a cell carrying the FGF receptor. Targetted agents (TA) other than saporin antisense DNA or other cytotoxic agent. The linker sequence within the fision protein may increases serum stability or intracellular caylleration in cells carrying the particular growth factor receptor; also when TA is DNA it can be used to deliver this factor receptor; also when TA is DNA it can be used to deliver this complication of perthelial cells, fibroblasts and keratinocytes in the anterior eye after surgery, partic. to prevent excessive proliferation of epithelial cells, fibroblasts and created include trabeculectomy after glaucoma surgery and corneal clouding after trabeculectomy after glaucoma surgery and corneal clouding after complications, Kapsosi's sarcoma and rheumatoid arthritis.

WHIT-) WHORD SPEARATIONS OF CYTOTOXIC CONJUGATES and DNA -

New monogenous preparations of cytotoxic agents for treating FGF conditions such as tumours, diabetes and rheumatoid arthitis.

Trating FGF conditions such as tumours, diabetes and rheumatoid arthitis.

S Disclosure; Page 108-109; 128pp; English.

Novel Fusion proteins comprise FGF linked to saporin. FGF-1 to -9 (may be used, pref. FGF-1 (R70812), FGF-5 (R70813), FGF-7 (R70814) or FGF-8 (R70815) muteins, in which at least 1 Cys residue is replaced by conservative Ser substitutions. The Fusion proteins are potent cytochtafl agents to Cells bearing the FGF receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                20-APR-1999 (first entry)
Human endothelial cell growth factor (ECGF) protein sequence.
Endothelial cell growth factor: ECGF; cleavable; recombinant; repair;
regenerate; blood vessel: endothelial cell; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               70 YIKSTETGQYLAMDTDGLLYGSQTPNEECLFLERLEENHYNTYISKKHAEKNWFVGLKKN 129

PT develophast growth factor feel) for the fibroblast growth factor femily and have homology to Fibroblast growth factor femily and have homology to Fibroblast growth factor homologous factor (FHF) proteins. The FHF proteins (FHF) proteins are involved in regulating the growth, survival, and differentiation of cells in the central nervous system, as well as cells in peripheral nervous tissues. The proteins can therefore be used for treating and diagnosing conditions involving the nervous system. FHF's can also be used in methods for maintaining cultured cells or tissues or to promote neuron growth in vitro.

The invention relates to DNA encoding human endothelial cell growth factors (EGGF) and plasmids comprising the DNA sequences. The DNA encodes a cleavable signal peptide and an ECGF, where removal of the signal peptide yields a mature form of the EGGF, where the EGGF is alpha-EGGF or beta-EGGF. The DNA is used to produce recombinant EGGF proteins, which can be used in treatments to repair or regenerate blood vessels or other structures lined with endothelial cells. The present sequence represents a human EGGF protein (the encoding cDNA determined from lambda EGGF clones 1 and 29).
                                                                                                                                                                                                                                         ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SS SDDFELSGSGDANYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEV 114

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gene encoding human beta-endothelial cell growth factor -
incorporates useful restriction sites at frequent intervals to
facilitate cassette mutagenesis at selected regions.
Disclosure: Fig 3a: 18pp; English.

The synthetic bECGF gene incorporates useful restriction sites at
frequent intervals to facilitate the cassette mutagenesis of
selected regions. Also included are flanking sites to simplify
the incorporation of the gene into any expression system.
bECGF is one of the factors involved in the regulation of
homeostasis of blood vessels acting in part through effects on
endothelial cells. Such factors may also play a role in stages
of atherosclerosis and tumour growth and development.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   damaged blood vessels, etc.

Example D. Frig 8; 22pp; Engdish.

Human endothelial cell growth factor (ECGF) is a mitogen for endothelial cells. Its amino acid sequence was deduced from a cobh clone (T4588F) isolated from a human brain stem library.

Recombinant ECGF-beta (W06616) and ECGF-alpha (W06817) can be produced in transformed host cells. They have utility in the prowth and amplification of endothelial cells in culture, and can potentially be used to treat damaged blood vessels and other endothelial cell-lined structures. They also have diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      26 TEKFNLP-PG--NYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEV

Compositions for promoting wound healing - containing endothelial cell growth factor polypeptides
Claim 1: Column 16; 23pp; English.
This sequence repersents the amino acid sequence of the mature human alpha endothelial cell growth factor (a-ECGF). The sequence was isolated from a human brain stem cell cDNA library using a probe designed based on fragments of the bovine ECGF (see W75416-W75418). The ECGF protein can be used in compositions for promoting wound healing. ECGF is also used to grow cells on a prosthetic device.

The actidic and basic fibroblast growth factors are the major endothelial-cell growth factors. Both are anglogenic agents in endothelial-cell growth factors. Both are anglogenic agents in vivo and are potent mitogens for a variety of mesodern-derived cell types in vitro (although bFGF is 30·100 times more potent than aFGF in stimulating the proliferation of normal diploid cells). There are differences in the tissue distribution and concentration of these two growth factors.

This protein binds heparin, although less strongly than does bFGF. There are some sequence similarities between residues 117-126 (a region flanked by Lys-Lys dippetides) and a number of neuropeptides, including a gastrin-releasing peptide from the pig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 #authors Risau, W.; Gautschi-Sova, P.; Boehlen, P.

#title Purification and partial characterization of a mitogenic factor from bovine liver: structural homology with basic fibroblast growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The acidic and basic flaroblast growth factors are the major rendethelial-cell growth factors. Both are angiogenic agents in vivo and are potent mitrogens for a variety of mesoderm-derived cell types in vitro (although bFGF is 30-100 times more potent than aFGF in stimulating the proliferation of normal diploid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             #title Isolation of fibroblast growth factor from bovine adrenal
  gland: physicochemical and biological characterization.

-!- FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIOCENIC AGENTS
IN VIVO AND ARE POTENT MITOGENS FOR A VARIETY OF CELL TYPES IN
VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND
CONCENTRATION OF THESE 2 GROWTH FACTORS.

-!- FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIGGENIC AGENTS
IN VIVO AND ARE DOTENT MITOGENS FOR A VARIETY OF CELL TYPES IN
VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND
CONCENTRATION OF THESE 2 GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -i- SUBUNIT: MONOMER.
-i- TISSUE SPECIFICITY: FOUND IN ALL THE TISSUES EXAMINED.
-i- MISCELLANEOUS: THIS PROTEIN BINDS HEPARIN MORE STRONGLY THAN DOES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cooksey K., Baird A., Ling N.; "Complementary DNA cloning and sequencing of rat ovarian basic fibroblast growth factor and tissue distribution study of its mRNA."; Biochem.
